

IN THE CLAIMS

Please amend claims 1, 24 and 34. Please cancel claim 10.

1. (Currently Amended) A method for exchanging information over a communications network, the method comprising:

connecting at least two clients to a proxy over the communications network;

activating a shared session between the at least two clients;

retrieving at least one web document pertaining to the shared session from a web site;

modifying the at least one web document with dynamic content associated with one or more references to the web site to replace the one or more references to the web site with one or more references to the proxy, the dynamic content depending at least partially on information stored outside of said web site;

incorporating at least one business rule into the at least one web document if the at least one business rule is applicable to the at least one web document; and

enabling co-navigation of the at least one web document with the dynamic content by the at least two clients during the shared session.

2. (Original) The method of claim 1 wherein the at least two clients include at least one customer and at least one company representative.

3. (Original) The method of claim 1 wherein connecting the at least two clients to the proxy includes receiving a message from any of the at least two clients, the message indicating a willingness to begin the shared session.
4. (Original) The method of claim 1 wherein activating the shared session between the at least two clients further includes:
 - collecting client state information; and
 - synchronizing browsers of the at least two clients using the client state information.
5. (Original) The method of claim 4 wherein the client state information includes a client cookie, an Internet address of a current web document displayed to a client, and relevant information from the current web document.
6. (Original) The method of claim 1 wherein any of the at least two clients is behind a firewall.
7. (Previously presented) The method of claim 1 wherein enabling the at least two clients to co-navigate includes:
 - presenting the at least one web document to the at least two clients; and
 - submitting responses received from any of the at least two clients to the web site.
8. Cancelled.

9. (Previously presented) The method of claim 1 wherein modifying the at least one web document includes:

identifying a dynamic event in the at least one web document; and
replacing a link directing the dynamic event to the web site with a link or code directing the dynamic event to a proxy.

10. Cancelled.

11. (Previously presented) The method of claim 1 wherein modifying the at least one web document includes replacing all references to a top frame in the web document with a code referencing a frame which would be the top window had the web document not been loaded in a co-navigation session.

12. (Previously presented) The method of claim 7 wherein submitting responses further includes:

receiving a web response from any of the at least two clients;
converting the web response to a web request; and
transferring the web request to the web site.

13. (Original) The method of claim 1 wherein co-navigating includes jointly completing a web form by the at least two clients.

14. (Original) The method of claim 1 further comprising:

a first client specifying an object on a web document displayed to the first client during the shared session; and

displaying the object on a web document displayed to a second client.

15. (Original) The method of claim 14 further comprising scrolling the web document displayed to the second client to a portion of the web document that includes the object.

16. (Original) The method of claim 1 further comprising selectively restricting web features from any of the at least two clients during the shared session.

17. (Original) The method of claim 1 further comprising selectively enabling web features from any of the at least two clients during the shared session.

18. (Original) The method of claim 1 further comprising selectively blocking personal information of a first client from a second client during the shared session.

19. (Original) The method of claim 1 wherein co-navigation is performed in a secure manner.

20. (Original) The method of claim 1 further comprising providing going back and forward functionality during the shared session.

21. (Original) The method of claim 1 wherein any of the at least two clients are connected to the proxy via a wireless carrier.

22. Cancelled.

23. Cancelled.

24. (Currently Amended) A system for exchanging information over a communications network, the system comprising:

a first client device, connected to the communications network;

a second client device, connected to the communications network, to issue a message indicating a willingness to begin a shared session; and

a co-navigation service, connected to the communications network, to receive the message from the second client device, to activate the shared session between at least a user of the first client device and a user of the second client device, to retrieve at least one web document pertaining to the shared session from a web site, to modify the at least one web document modifying the at least one web document with dynamic content associated with one or more references to the web site to replace the one or more references to the web site with one or more references to the proxy, the dynamic content depending at least partially on information stored outside of said web site, to incorporate at least one business rule into the at least one web document if the at least one business rule is applicable to the at least one web document, and to enable co-navigation of the at least one web document with the dynamic content by at least the user of the first client device and the user of the second client device during the shared session.

25. (Original) The system of claim 24 wherein the user of the first client device is a company representative, and the user of the second client device is a customer.

26. (Original) The system of claim 24 wherein each of the first client device and the second client device comprises:

- an applet to establish connection with the co-navigation service; and
- a shared browser to present the at least one web document to a user.

27. (Original) The system of claim 24 wherein the co-navigation service comprises:

- a routing server to manage web requests, load balancing and routing;
- at least one application server to maintain a plurality of shared sessions; and
- a database server to authenticate participants of the plurality of shared sessions and store information related to each of the plurality of shared sessions.

28. (Original) The system of claim 27 wherein each application server includes:

- communication drivers to maintain connection between the application server and each of a plurality of client devices during a corresponding shared session;

- a session manager to establish and coordinate the plurality of shared sessions;

- a web server to transfer requests from the co-navigation service to corresponding client devices;

- a co-navigation engine to provide co-navigation functionality during the shared session; and

- at least one server integration application programming interface (API) to provide an interface between the co-navigation service and at least one third party system.

29. (Original) The system of claim 28 wherein the co-navigation engine further includes:

a parsing and lexing engine to retrieve web documents from a web site, to prepare the web documents for display to corresponding participants of the shared session, and to submit responses received from any of the participants to a web site;

a business rule engine to maintain a plurality of predefined business rules pertaining to co-navigation, the plurality of predefined business rules being used in preparing the web documents for display during the shared session;

a shared state manager to maintain state information during the shared session;
and

a pseudo client to retrieve web documents from web sites and to send requests to the web sites.

30. (Original) The system of claim 29 wherein the parsing and lexing engine is capable of identifying every dynamic event in the web document, replacing links directing dynamic events to the web site with links directing the dynamic events to the proxy, and modifying the web document according to predefined business rules.

31. (Original) The system of claim 29 wherein the co-navigation engine is configured to provide joint completion of a web form by participants of the shared session.

32. (Original) The system of claim 24 wherein co-navigation is performed in a secure manner.

33. (Original) The system of claim 24 wherein any of the client devices are connected to the co-navigation service via a wireless carrier.

34. (Currently Amended) A computer readable medium comprising instructions, which when executed on a processor, perform a method for exchanging information over a communications network, the method comprising:

connecting at least two clients to a proxy over the communications network;

activating a shared session between the at least two clients;

retrieving at least one web document pertaining to the shared session from a web site;

modifying the at least one web document with dynamic content associated with one or more references to the web site to replace the one or more references to the web site with one or more references to the proxy, the dynamic content depending at least partially on information stored outside of said web site;

incorporating at least one business rule into the at least one web document if the at least one business rule is applicable to the at least one web document; and

enabling co-navigation of the at least one web document with the dynamic content by the at least two clients during the shared session.
